Introduction to Mathematical Economics

Div Bhagia

Lecture 1: Preliminaries

Today's Topics & References

- Numbers and sets (sections 2.2 and 2.3)
- Relations and functions (sections 2.4-2.6, page 163)
- Summation notation (handout)
- Necessary and sufficient conditions (beginning of 5.1)

Numbers and Sets

Real-Number System

- *Integers:*

$\dots, -3, -2, -1, 0, 1, 2, 3, \dots$

Real-Number System

- *Integers:*

$\dots, -3, -2, -1, 0, 1, 2, 3, \dots$

- *Fractions:*

$\frac{1}{2}, \frac{3}{5}, -\frac{2}{3}$

Real-Number System

- *Integers:*

$\dots, -3, -2, -1, 0, 1, 2, 3, \dots$

- *Fractions:*

$\frac{1}{2}, \frac{3}{5}, -\frac{2}{3}$

- *Rational numbers:* ratio of integers

Real-Number System

- *Integers:*

$\dots, -3, -2, -1, 0, 1, 2, 3, \dots$

- *Fractions:*

$\frac{1}{2}, \frac{3}{5}, -\frac{2}{3}$

- *Rational numbers:* ratio of integers

Are fractions rational numbers? What about integers?

Real-Number System

- *Rational numbers*: ratio of integers
“terminating or repeating decimal”

Example. $\frac{1}{3} = 0.333$, $\frac{1}{4} = 0.25$

Real-Number System

- *Rational numbers*: ratio of integers
“terminating or repeating decimal”

Example. $\frac{1}{3} = 0.333$, $\frac{1}{4} = 0.25$

- *Irrational numbers*: cannot be expressed as a ratio of two integers
“nonterminating or nonrepeating decimal”

Example. $\sqrt{2} = 1.4142$, $\pi = 3.1415$

Real-Number System

- *Rational numbers*: ratio of integers
“terminating or repeating decimal”

Example. $\frac{1}{3} = 0.333$, $\frac{1}{4} = 0.25$

- *Irrational numbers*: cannot be expressed as a ratio of two integers
“nonterminating or nonrepeating decimal”

Example. $\sqrt{2} = 1.4142$, $\pi = 3.1415$

- *Real numbers* (\mathbb{R}): rational and irrational

Sets

- A *set* is a collection of distinct objects.

$$A = \{brownies, icecream, pizza, ramen\}$$

- $pizza \in A$, \in stands for 'is in'

Sets

- A *set* is a collection of distinct objects.

$$A = \{brownies, icecream, pizza, ramen\}$$

- $pizza \in A$, \in stands for 'is in'
- What about sets B and C ?

$$B = \{x | x \text{ is a positive integer}\}$$

$$C = \{x | 1 < x < 5\}$$

Set Relations

1. Equivalence (=)

$$A = \{brownies, icecream, pizza, ramen\}$$

$$B = \{pizza, ramen, icecream, brownies\}$$

$$A = B$$

Set Relations

1. Equivalence ($=$)

$$A = \{brownies, icecream, pizza, ramen\}$$

$$B = \{pizza, ramen, icecream, brownies\}$$

$$A = B$$

2. Subset (\subset)

$$C = \{pizza, ramen\}$$

$$C \neq A \text{ but } C \subset A.$$

Note: $A \supset C$ is equivalent.

Set Relations

1. Equivalence ($=$)

$$A = \{brownies, icecream, pizza, ramen\}$$

$$B = \{pizza, ramen, icecream, brownies\}$$

$$A = B$$

2. Subset (\subset)

$$C = \{pizza, ramen\}$$

$C \neq A$ but $C \subset A$.

Note: $A \supset C$ is equivalent.

Is $A \subset B$?

Set Relations

1. Equivalence ($=$)

$$A = \{brownies, icecream, pizza, ramen\}$$

$$B = \{pizza, ramen, icecream, brownies\}$$

$$A = B$$

2. Subset (\subset)

$$C = \{pizza, ramen\}$$

$C \neq A$ but $C \subset A$.

Note: $A \supset C$ is equivalent.

Is $A \subset B$? Yes, but C is a proper subset of A .

Set Relations

3. Disjoint sets

$$A = \{brownies, icecream, pizza, ramen\}$$

$$D = \{salad, fruits\}$$

Set Relations

3. Disjoint sets

$$A = \{brownies, icecream, pizza, ramen\}$$

$$D = \{salad, fruits\}$$

4. Neither but still related

$$A = \{brownies, icecream, pizza, ramen\}$$

$$E = \{salad, fruits, icecream\}$$

Set Relations

- \emptyset : empty or null set

Set Relations

- \emptyset : empty or null set
- What are all possible subsets of

$$S = \{a, b, c\}$$

Set Relations

- \emptyset : empty or null set
- What are all possible subsets of

$$S = \{a, b, c\}$$

$$\emptyset, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}, \{a, b, c\}$$

Set Relations

- \emptyset : empty or null set
- What are all possible subsets of

$$S = \{a, b, c\}$$

$$\emptyset, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}, \{a, b, c\}$$

Always 2^n subsets. Here $n = 3$, so 8 subsets.

Set Operations

1. *Union*: $A \cup B$, elements in either A or B
2. *Intersection*: $A \cap B$, elements in both A and B

Example:

$$A = \{brownies, icecream, pizza, ramen\}$$

$$B = \{salad, fruits, icecream\}$$

$$A \cup B =$$

$$A \cap B =$$

Set Operations

1. *Union*: $A \cup B$, elements in either A or B
2. *Intersection*: $A \cap B$, elements in both A and B

What about

$$A = \{brownies, icecream, pizza, ramen\}$$

$$B = \{salad, fruits\}$$

$$A \cup B =$$

$$A \cap B =$$

Set Operations

3. *Complement of A: \tilde{A} , 'not A'*

Universal set U (context specific) then:

$$\tilde{A} = \{x | x \in U \text{ and } x \notin A\}$$

Example. $U = \{1, e, f, 2\}$, $A = \{1, 2\}$, then $\tilde{A} = \{e, f\}$.

Set Operations: Venn Diagrams

Laws of Set Operations

- Commutative law

$$A \cup B = B \cup A \quad A \cap B = B \cap A$$

- Distributive law

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

Distributive law

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

A

$B \cap C$

Distributive law

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

$A \cup B$

$A \cup C$

Ordered Sets

- We said order does not matter for sets
- But we can have ordered sets where

$$(a, b) \neq (b, a) \text{ unless } a = b$$

- Ordered pairs, triples,...

Example. (*age, weight*), (22, 120) different from (120, 22)

Cartesian Product

$$A = \{1, 2\} \quad B = \{3, 4\}$$

Cartesian Product: set of all possible ordered pairs

$$A \times B = \{(1, 3), (1, 4), (2, 3), (2, 4)\}$$

Cartesian Plane

$$\mathbb{R}^2 = \{(x, y) | x \in \mathbb{R}, y \in \mathbb{R}\}$$

Can have $\mathbb{R}^3, \mathbb{R}^4, \dots, \mathbb{R}^n$

Relations and Functions

Relations

Relation: subset of the Cartesian product

Example. $\{(x, y) | y \leq x\}$

Functions

Function: a relation where for each x there is a unique y

$$f : X \rightarrow Y, \quad y = f(x)$$

Examples. $y = x, y = x^2, y = 2x + 3$

X : domain, Y : codomain, $f(X)$: range

Most functions we will encounter, $f : \mathbb{R}^k \rightarrow \mathbb{R}$

Functions

Let's say,

$$f : X \rightarrow \mathbb{R}, \quad y = 3x - 5$$

where $X = \{2, 3, 4\}$.

What is the range?

Cost Function

Consider the total cost C of producing hats Q ,

$$C = f(Q)$$

- Should I be able to produce 10 hats and 5 hats at the same cost?
- Possible to produce 5 hats for \$20 and \$25?

By the way

Consider the total cost C of producing hats Q ,

$$C = f(Q) = 2Q + 5$$

What is the cost of producing 1 hat?

What is the cost of producing 2 hats?

How many hats can I produce for \$25?

Types of Functions

- Constant: $y = f(x) = 5$
- Polynomial of degree n
 - $n = 0$, constant
 - $n = 1$, linear
 - $n = 2$, quadratic
 - $n = 3$, cubic
 - ...
- Rational function: ratio of two polynomial functions:

$$y = \frac{a}{x}$$

Function of More than One Variables

Functions can be of two variables:

$$z = g(x, y)$$

Or three, or four,..., or n

Monotonic functions

Strictly increasing function:

$$x_1 > x_2 \rightarrow f(x_1) > f(x_2)$$

Strictly decreasing function:

$$x_1 > x_2 \rightarrow f(x_1) < f(x_2)$$

Increasing function:

$$x_1 > x_2 \rightarrow f(x_1) \geq f(x_2)$$

Decreasing function:

$$x_1 > x_2 \rightarrow f(x_1) \leq f(x_2)$$

Inverse of a function

Function $y = f(X)$ has an inverse if it is a one-to-one mapping, i.e. each value of y is associated with a unique value of x .

Inverse function

$$x = f^{-1}(y)$$

returns the value corresponding value of x for each y .

One-to-one mapping unique to strictly monotonic functions

Inverse of a function

Example: Find the inverse of $y = f(x) = 3x - 2$.

By the way

What is $x \times x$?

What is $x^2 \times x$?

What is $x^2 \times x^2$?

More generally, $x^n \times x^m = x^{m+n}$

Summation Notation

Summation Notation

$$\sum_{i=1}^N x_i = x_1 + x_2 + \dots + x_N$$

Example:

$$x = \{2, 9, 6, 8, 11, 14\}$$

$$\sum_{i=1}^4 x_i = x_1 + x_2 + x_3 + x_4 = 2 + 9 + 6 + 8 = 25$$

Summation Notation

Another way of using a summation sign is to write

$$\sum_{x \in A} x$$

which refers to summing up all elements in A .

To sum up x for all possible values x , we can simply write

$$\sum_x x$$

Things you CAN do

1. Pull constants out of or into the summation sign.

$$\sum_{i=1}^N bx_i = b \sum_{i=1}^N x_i$$

Things you CAN do

2. Split apart (or combine) sums (addition) or differences (subtraction)

$$\sum_{i=1}^N (bx_i + cy_i) = b \sum_{i=1}^N x_i + c \sum_{i=1}^N y_i$$

Things you CAN do

3. Multiply through constants by the number of terms in the summation

$$\sum_{i=1}^N (a + bx_i) = aN + b \sum_{i=1}^N x_i$$

Things you CANNOT do

1. Split apart (or combine) products (multiplication) or quotients (division).

$$\sum_{i=1}^N x_i y_i \neq \sum_{i=1}^N x_i \times \sum_{i=1}^N y_i$$

Things you CANNOT do

2. Move the exponent out of or into the summation.

$$\sum_{i=1}^N x_i^a \neq \left(\sum_{i=1}^N x_i \right)^a$$

Necessary and Sufficient Conditions

Necessary vs. Sufficient Conditions

q is a necessary condition for p if:

$$p \implies q$$

Necessary vs. Sufficient Conditions

q is a necessary condition for p if:

$$p \implies q$$

p : I ate tofu for dinner

q : My dinner had protein

Necessary vs. Sufficient Conditions

q is a sufficient condition for p if:

$$p \Leftarrow q$$

Necessary vs. Sufficient Conditions

q is a sufficient condition for p if:

$$p \Longleftarrow q$$

p : A number is even

q : A number is divisible by 4

Necessary vs. Sufficient Conditions

q is both necessary and sufficient for p

$$p \iff q$$

Necessary vs. Sufficient Conditions

q is both necessary and sufficient for p

$$p \iff q$$

p : A number is even

q : A number is divisible by 2

Necessary vs. Sufficient Conditions

p : It is a holiday

q : It is Thanksgiving

Necessary vs. Sufficient Conditions

p : The car is out of gas

q : The car isn't starting

Necessary vs. Sufficient Conditions

p : A geometric figure has four sides

q : It is a rectangle

Homework Questions

- Exercise 2.3: 1, 2
- Exercise 2.4: 5, 7, 8
- Exercise 2.5: 1 (For each part, find the inverse of the function too.)
- Exercise 4.2: 6, 8
- Exercise 5.1: 1
